

Hydrology
 Water is the basis for settlement in this area, and the bosque is sustained by the water. The lack of water as flood event and lower water table are key reasons why the Bosque is has become degraded. The historic floodplain is inscribed by the light shading. The acequia, drain and storm sewer systems are critical to how water is distributed throughout the former flood plain and then returned to the river. Points of return flow for all the systems are marked as outfalls, which are potential over-banking or wetland areas. Production wells indicated because of their impact on the nearby water table.
