

**Vegetation Cover**  
 The colors in this map are representative of existing vegetation based satellite imagery. The dark green areas are interpreted as forest canopy, cottonwood dominant areas. Red areas are interpreted as woodland or successional areas where understory grasses or shrubs such as salt cedar, Russian olive and coyote willow are the predominant species. This type would have the greatest contingent of exotic species. Green areas are irrigated lawn or pasture and yellow areas are irrigated croplands. Grey areas are predominantly urban or unvegetated.
